# **1 Aims of the experiment**

The aim of this experiment is to understand the tools used in the electronics lab course. In order to do so, the termini of bandwidth and ramp-up time are introduced.

## 2 Theoretical background

### 2.1 Amplitudes of AC voltage

To describe AC voltage amplitudes, the following voltages can be used:

$$\begin{aligned} \text{peak-to-peak-voltage: } U_{PP} &= \max\{U(t)\} - \min\{U(t)\} \\ \text{peak-voltage (symmetric and most times also asymmetric voltage): } U_P &= \max\{|U(t)|\} \\ \text{root-mean-square-amplitude-voltage: } U_{RMS} &= \sqrt{\langle U^2(t) \rangle} \end{aligned}$$

### 2.2 Measuring instruments

Every measuring instrument is made up of two parts:

- Measuring unit
- Displaying unit

#### 2.2.1 Measuring unit

The measuring unit measures the measurand and controls the displaying unit. It is made up of itself of another 3 subunits:

- Measuring amplifier
- Area selection network
- Measuring converter

#### 2.2.2 Displaying unit

The displaying unit allows us to read the value of the measurement. If the measuring instrument is an analogue one, it consists of a pointer a coil which steers the pointer and a scale. If it is a digital one, it consists of a counter which -most times- gets it's input from a so called dual-slope converter<sup>1</sup> and a LCD.

### 2.3 The oscilloscope

The oscilloscope is a measuring instrument for voltage. It steers an electron-beam through plate-capacitors, which stand perpendicular to each other (x-steering: time, y-steering: measurand), which allows to observe processes by time.

For a static display, a toggle switch and the trigger are used. The toggle switch steers the electron-beam back to the beginning of the scale, after it passes it's end. For a static display, the period of the process must be a integer multiple of the displaying-period. That is, what the trigger is for.

---

<sup>1</sup>it measures a measurand by the time it takes to discharge a build-in capacitor

### 3 Preperational exercises

#### 3.1 0.2.1.A

$$\begin{aligned}U(t) &= U_0 \cdot \sin(\omega t) \\U_{PP} &= 2 \cdot U_0 \\U_P &= U_0 \\U_{RMS} &= \frac{U_0}{\sqrt{2}}\end{aligned}$$

#### 3.2 0.2.1.B

For a symmetrical rectangular voltage<sup>2</sup>

$$\begin{aligned}U_{RMS} &= \frac{U_0}{\sqrt{2}} \\&= 7.07 \text{ V}\end{aligned}$$

#### 3.3 0.2.2.C

##### 3.3.1 0.2.2.C.1

$$\begin{aligned}\text{To proof: } R_i &= \frac{U_2 - U_1}{I_1 - I_2} \\U_n &= U_0 \frac{R_n}{R_n + R_i} \\I_n &= \frac{U_n}{R_n} \\\Leftrightarrow I_n &= U_0 \frac{1}{R_n + R_i} \\U_2 - U_1 &= U_0 \left( \frac{R_2}{R_2 + R_i} - \frac{R_1}{R_1 + R_i} \right) \\I_1 - I_2 &= U_0 \left( \frac{1}{R_1 + R_i} - \frac{1}{R_2 + R_i} \right) \\\Rightarrow \frac{U_2 - U_1}{I_1 - I_2} &= \frac{\left( \frac{R_2}{R_2 + R_i} - \frac{R_1}{R_1 + R_i} \right)}{\left( \frac{1}{R_1 + R_i} - \frac{1}{R_2 + R_i} \right)} \\&= \frac{R_2(R_1 + R_i) - R_1(R_2 + R_i)}{R_2 + R_i - R_1 - R_i} \\&= \frac{R_i(R_2 - R_1)}{R_2 - R_1} \\&= R_i\end{aligned}$$

---

<sup>2</sup>In this case with  $U_P = 10 \text{ V}$

### 3.3.2 0.2.2.C.2

$$\begin{aligned}U_0 &= 10 \text{ V} \\U_n(50 \Omega) &= 5 \text{ V} \\U_n &= U_0 \frac{R_n}{R_n + R_i} \\ \Rightarrow R_i &= 50 \Omega\end{aligned}$$

### 3.4 0.3.3.E

$$\begin{aligned}\text{To proof: } B\Delta t &= 0.35 \\B &= \frac{1}{2\pi\tau} \\\Delta t &= t(0.9U_0) - t(0.1U_0) \\\text{Decharging-function of a capacitor: } U(t) &= U_0 \exp\left(-\frac{t}{\tau}\right) \\\frac{0.1}{0.9} &= \exp\left(-\frac{\Delta t}{\tau}\right) \\\Leftrightarrow \Delta t &= -\ln\left(\frac{1}{9}\right) \tau \\&= 2.197\tau \\\Rightarrow B\Delta t &= \frac{2.197}{2\pi} \\\approx &0.35\end{aligned}$$

## 4 Procedure

### 4.1 0.4.1.a

Different signals at different frequencies and amplitudes shall be observed at the oscilloscope.

In order to do so, we connect the CH1-input of the oscilloscope with generator-output by BNC. The BNC is connected without reflexion and the oscilloscope is triggered.

### 4.2 0.4.1.b

$\Delta t$  of a rectangular voltage shall be determined by measuring the delay from  $0.1U_0$  to  $0.9U_0$  with the oscilloscope.<sup>3</sup>

---

<sup>3</sup>We must also pay attention to the bandwidth of the oscilloscope which is - so says the manual - 60 MHz

## 5 Measurement

### 5.1 0.4.1.a

The following signals were observed:

- Sinus
- Triangular
- Rectangular
- pos. ramp
- neg. ramp

### 5.2 0.4.1.b

$t$  at 10%:  $0.45\text{Scp.}$

$t$  at 90%:  $0.18\text{Scp.}$

$1\text{Scp.}[t] = 0.05\text{s}$

$1\text{Scp.}[U] = 0.5\text{V}$

$f = 2\text{MHz} = B$

$U_{PP} = 2.6\text{V}$

$$\Delta\text{Scp.} = 0.05$$

## 6 Evaluation
